As our cities continue to grow, electric hungry and bulk buildings are being erected without interacting with nature or people. Typical buildings only exhaust natural resources by consuming too much energy and dense concrete facades just push people away from the street level. Block 162 will be a self-sustaining building with a south-facing solar fiber facade to harvest Denver’s 300 days of sunlight and will interact with locals and tourists by transitioning a hardscape facade to a softscape park. Block 162 will work not again but with nature and people.
