The concept of the design intervention is using a living system to affect flow within the site as a response to site density conditions. Different living systems will create a variety of densities along 43rd street. The living systems will reflect site ground conditions of density and storm water management. Horizontal and vertical elements will collectively create different experiential moments and social uses along the 43rd street transect. The design elements will be placed according to pedestrian flow and movement through the site. Design elements will reflect site density conditions and directly influence social use and flow through the space.
Site Flow in Response to Conditions of Density
